

## Using the Interactive *Articulate* Power Points

If you click on one of the presentations that is displayed in Power Point format, it will open a new browser window with a “loading” screen that shows this:

When it is finished loading, you will see a screen that looks similar to this:

1. **Slide Show** - This is where the power point slides will be displayed.
2. **Side Bar** - This is a list of every slide in the power point. You may click on any of these slides and it will jump directly to that slide.
3. **Views** - This is a menu of different displays you can show on the left toolbar. They are discussed later on this document.
4. **Control Bar** – Since the power point is timed, this allows you to pause or skip to the next slide if you wish. If the power point had audio, you would also have the ability to control the volume.
5. **Full Screen** – This will remove the side menu and display only the power point within the outer frame.

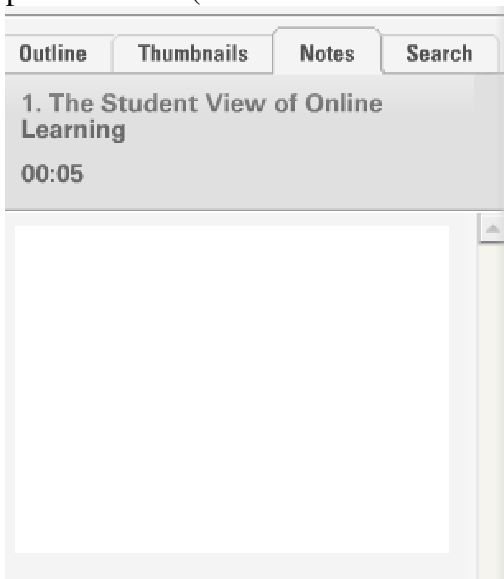

### Side Bar Displays

**Outline** – This is the display you see above, listing all the slides in the show

**Thumbnails** – This will display the slides similarly to what you sometimes see in power point, like this:

**Notes** – This will display the slide you are currently on with text notes on the page when developed in power point like this (the white area will be filled in with the notes):

**Search** – This will allow you to search for a specific slide, typing in the title or keywords. This won't be necessary unless it is an extremely extensive slide.
